VET CLAMP

- Suitable for all types of cattle handling procedures, including embryo transplants.
- It comes with a standard Tal-Tec neck clamp which is suitable for all sizes cattle.
- The floor has a 12° gradient as required by a veterinary surgeon for embryo transplanting.
- A box gate is optional extra for easy access to the animal.
- Checker plated steps to prevent the cattle from slipping.

Dimensions without box gate:
- Length: 2.20m
- Height: 2.10m
- Width: 0.91m
- Weight: 245kg
• It’s frightening when one of your cows lies down and can’t get up again.

• Lying down restricts blood circulation, and muscular degeneration follows.

• Normal excretory functions will also be prevented, as they are done in a standing position.

• The clamp is first secured around the hip bones of the cow, and then using a block-and-tackle she is lifted to her feet.

• You will notice once you have lifted her hind quarters, she will stand on her front legs by herself.

• The clamp is only an aid into helping the cow stand up, not for holding the cow in an upright position.

• The tri-pod and block-and-tackle is available as an optional extra.
